

How does Curodont Repair Fluoride Plus work?

Easy in-office application

Treatment is straightforward and efficient.

Taking as little as five minutes, application can be integrated into most appointment types.

Curodont Repair Fluoride Plus is applied directly onto the cleaned surface of the decay and allowed to dry for five minutes.

Curodont Repair Fluoride Plus treats and remineralizes early carious lesions, including white spot lesions, from the inside out.

After as little as one application, Curodont Repair Fluoride Plus acts where it is needed.

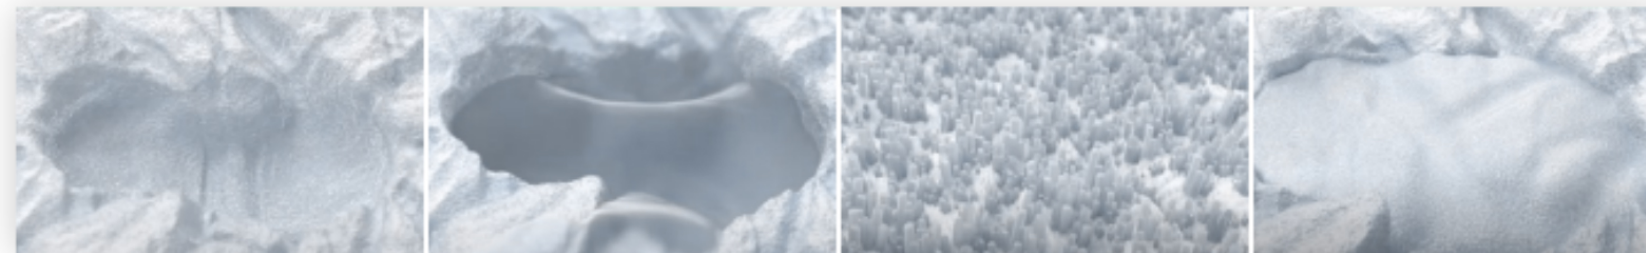

Over the course of weeks, the unique **CUROLOX** formulation and the application procedure help minerals, like calcium and phosphate found in saliva, to penetrate the enamel surface into the early carious lesion. Lost enamel is remineralized and re-hardened.

Please avoid eating or drinking for 30 minutes after application.

Initial results are visible in about 90 days. Although one application is typically enough, Curodont Repair Fluoride Plus can be reapplied at 3-6 month intervals.
